Abstract— People are exposed to different risk forms and the risk levels can vary. These dangers contain the risk of death, health and property loss or assets. But, risks cannot usually be avoided. Insurance is, therefore, a policy that decreases or removes loss costs incurred by various risks. Insurance provider they use different tools to calculate insurance premium. ML is beneficial here. These ML models can be learned by themselves, the model is trained on insurance data from the past. The requisite factors to measure the payments can then be defined as the model input, then the model can correctly anticipate insurance policy costs. The regression is the best choice available to fulfill our needs. We use Multiple Linear Regression in this analysis since there are many independent variables used to calculate dependent(Target) variable. To make this predictions more visualize Forecasting can be useful in this case. The key reason for this study is to include a new way of estimating insurance costs.

Keywords: Machine Learning, Flask API, Linear Regression

I. INTRODUCTION

We are on a planet full of threats and uncertainty. People, households, companies, properties, and property are exposed to different risk forms and the risk levels can vary. These dangers contain the risk of death, health, and property loss or assets. Life and wellbeing are the greatest parts of people's lives. But, risks cannot usually be avoided, so the world of finance has developed numerous products to shield individuals and organizations from these risks by using financial capital to reimburse them. Insurance is, therefore, a policy that decreases or removes loss costs incurred by various risks. Concerning the value of insurance in the lives of individuals, it becomes important for the companies of insurance to be sufficiently precise to measure or quantify the amount covered by this policy and the insurance charges which must be paid for it.

Various variables estimate these charges. Each factor of these is important. If any factor is omitted when the amounts are computed, the policy changes overall. It is therefore critical that these tasks are performed with high accuracy. As human mistakes can occur, insurers use people with experience in this area. They also use different tools to calculate the insurance premium. ML is beneficial here. ML may generalize the effort or method to formulate the policy. These ML models can be learned by themselves. The model is trained on insurance data from the past. The requisite factors to measure the payments can then be defined as the model inputs, then the model can correctly anticipate insurance policy costs. This decreases human effort and resources and improves the company's profitability. Thus the accuracies can be improved with ML. Our objective is to forecast insurance charges in this article. The value of insurance fees is based on different variables. As a result, insurance fees are continuous values. The regression is the best choice available to fulfill our needs. We use multiple linear regression in this analysis since there are many

independent variables used to calculate the dependent(target) variable. For this study, the dataset for cost of health insurance is used. Preprocessing of the dataset done first. Then we trained regression models with training data and finally evaluated these models based on testing data. The key reason for this study is to include a new way of estimating insurance costs.

II. LITERATURE SURVEY

- 1) M. A. Morid, K. Kawamoto, T. Ault, J. Dorius and S. Abdelrahman, "Supervised Learning Methods for Predicting Healthcare Costs: Systematic Literature Review and Empirical Evaluation", AMIA Annual Symposium Proceedings, vol. 2017, pp. 1312, 2017. An important informatics tool for controlling healthcare costs is accurately predicting the likely future healthcare costs of individuals. To address this important need, we conducted a systematic literature review and identified five methods for predicting healthcare costs. To enable a direct comparison of these different approaches, we empirically evaluated the predictive performance of each reported approach, as well as other state-of-the-art
- 2) Philipp Drewe-Boss, Dirk Enders, Jochen Walker and Uwe Ohler, "Deep learning for prediction of population health costs", BMC Medical Informatics and Decision Making, vol. 22, no. 1, pp. 1-10, 2022. Accurate prediction of healthcare costs is important for optimally managing health costs. However, methods leveraging the medical richness from data such as health insurance claims or electronic health records are missing. Here, we developed a deep neural network to predict future cost from health insurance claims records. We applied the deep network and a ridge regression model to a sample of 1.4 million German insurance to predict total one-year health care costs.
- 3) MC Politi, E Shacham, AR Barker, N George, N Mir, S Philpott et al., "A Comparison Between Subjective and Objective Methods of Predicting Health Care Expenses to Support Consumers". Number of electronic tools help consumers select health insurance plans based on their estimated health care utilization. However, the best way to personalize these tools is unknown. The purpose of this study was to compare two common methods of personalizing health insurance plan displays: 1) quantitative healthcare utilization predictions using nationally representative Medical Expenditure Panel Survey (MEPS) data and 2) subjective-health status predictions.
- 4) C. A. Powers, C. M. Meyer, M. C. Roebuck healthcare costs using pharmacy claims data: A comparison of alternative econometric cost modeling techniques", Med. Care, vol. 43, pp. 1065-1072, 2005. We sought to evaluate several statistical modeling approaches in predicting prospective total annual health costs (medical plus pharmacy) of health Dimensions (PHD), a

- pharmacy claims-based risk index. Methods. We undertook a 2-year (baseline year/follow-up year) longitudinal analysis of integrated medical and pharmacy
- 5) H. Dove, I. Duncan and A. Robb, "A prediction model for targeting low-cost high-risk members of managed care organizations", *Amer. J. Managed Care*, vol. 9, pp. 381-389, 2003. To describe the development and validation of a predictive model designed to likely incur high costs. Study Design: Split-sample multivariate regression analysis. Patients and Methods: We studied enrollees in a 350 000-member HMO with 1 claim in 1998 and 1999. The prediction model uses a combination of clinical and behavioral variables and 1998 and 1999 claims data.
 - 6) Svetlana Sokolov Mladenovic, Milos Milovancevic and Igor Mladenovic, "Identification of the important variables for prediction of individual medical in Society", vol. 62, pp. 101307, August 2020. The cost of health care insurance is one of the most important factors in the health care development. To establish a better health care system, there is a need to estimate the cost of health insurance. The prediction of the cost is one possibility to improve health care development. There is a need for more advanced methods other than traditional regression approaches, because the prediction of the health insurance costs.
 - 7) Roman Tkachenko, Ivan Izonin, Natalia Kryvinska and Valentyna Chopyak, "Piecewise-linear Approach for Medical Insurance Costs Prediction using SGTM Neural-Like Structure Conference: Proceedings of the 1st International Workshop on Informatics & Data-Driven Medicine (IDDM 2018)". The article proposes a new insurance medical cost prediction method. It is based on the piecewise-linear approach using the SGTM neural-like structure. Piecewise-linear approach provides high processing efficiency for large amounts of data, and the SGTM neural-like structure provides high accuracy and high-speed training procedure. The simulation of the proposed method using real data on health insurance costs and two SGTM neural-like structure cascades was performed.

The increasing trend of claim frequency and claim severity for auto insurance result in need of methods to quickly of them is machine learning that treats the problem as supervised learning. The volume of the historical claim data is usually large. Moreover, there are many missing values for many features of the data. Therefore, we need machine learning models that can handle both data characteristics.
 - 9) A. Ravishankar Rao, Daniel Clarke, "A comparison of models to predict medical procedure costs from open public healthcare data", 2018 International Joint Conference on Neural Networks (IJCNN), pp.1-8, 2018. In our earlier work, we presented BOAT, a big-data open-source analytics toolkit and framework, and applied it to analyze trends and outliers in public healthcare data. In this paper, we extend different medical procedures that patients Specifically, we analyze

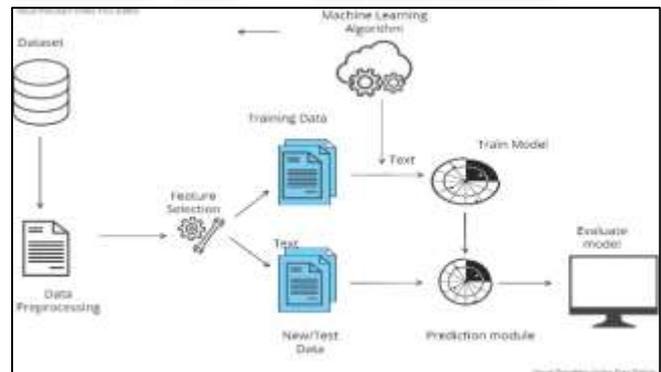

de identified patient data from New York State SPARCS (statewide planning and research cooperative system), consisting of more than 2 million records.

- 10) Liwen Cui, Xiaolei Xie, Zuojun Shen, Rui Lu, Haibo Wang, "Prediction of the healthcare resource utilization using multi-output regression models", *IIE Transactions on Healthcare Systems Engineering*, vol. 8, no. 4, pp. 291, 2018. With the rapidly increasing healthcare cost and the scarcity of inpatient resources, it is of paramount importance to accurately predict the healthcare resource utilization. Previous research mainly focuses on predicting the healthcare cost using single-output models. However, the intensity of the healthcare resource utilization is reflected by multiple measures.

III. WORKING

In Insurance Premium Prediction we can predict the insurance premium easily. We are going to have a dataset related to the same cost prediction we are going to explore that dataset for better understanding of features that are going to be used in cost prediction. There will be several features on basis of which we are going to predict the premium. We are going to split data that into two parts as training data and test data, furthermore we are going to make a linear regression and pass both the data we made from the given dataset and train that model on that training and test data. With all that can predict cost of insurance easily. On the basis of features like age, smoker, BMR, how many children they have. When user passes the all expected features the model will predict and show the output to the user. For the better UI or interface we are going to use Flask API that is python framework that will make user experience more attractive.

IV. ARCHITECTURE

V. CONCLUSION

It uses machine learning regression model to forecast premium of Insurance based on specific attributes. ML models can perform cost calculations in a short time, while a human being would be taking a long time to perform the same task. This will help businesses improve their profitability. The ML models can also manage enormous amounts of data.
