Abstract— The goal of this project is to create an online database of service providers. The entire project has been designed with distributed client-server computing in mind. If service providers wish to preserve their jobs, they must establish an e-Information about themselves. Service providers can assist their customers while also earning a good living. Anyone who needs assistance with domestic tasks, such as a mechanic, plumber, carpenter, or movers and packers, can register through this app. This Home Service Application project is designed to assist people who are new to a certain location. This Android project is designed to save thorough information as well as distinct information about all of the places where service providers are present. We attempted to create this system because there are times when someone requires immediate assistance and we are unfamiliar with the people or shops in the area because we are new to the area. In these cases, this software proved to be his best friend and assisted the person in quickly locating a location near him. Admin is the ultimate authority who can add, delete, and modify data as needed.

Keywords: Homie Mart Domestic Services

I. INTRODUCTION

In the below concept we identified the problem that whenever we go to a new city or relocate, or sometimes at our own house we need some work done like electrician, plumber, mason, etc. So we need to go to Hardware and ask them for contacts of workers and stuff. This task is complicated and many times we don't have assurance and quality of the work the person will do.

This app would bridge the gap between people at home, (customers) and people out with no work (workers).and connect them on a single platform. That is safe, trustful and has verified users. we have such an already existing service like an urban company.. But here the company itself plays a major role in providing training and formalizing the workers also they are salaried in some cases. Thus increasing the cost of work

II. PURPOSE

The purpose of this project is to bridge the gap between unemployed workers and needy consumers, who are in need of getting work done.

A. Problem:

So this is applicable for the small workers or helpers who are perfect in their work but don't get attention as they are not highly qualified or for any other reasons. We came across the problem of these small workers (like mechanic, technician, carpenter, painter, plumber, electrician, etc) who work in small shops and cannot earn well. But when these people are in our neighborhood we can easily call them and can help with our problems. But what if we don't have their contact even if they are our neighbors or live in our society or what if

we are shifted to new places, we are not aware of people,shops etc.

B. Goals:

So for this problem, we aim to create one application where such small workers can register their information by creating there account on this app and the user/customer who wants help can also create their profile can choose among the services and can find the helper's contact information near their areas with the help our application and through this customers can easily find the helpers and the service providers can earn extra by registering themselves on our app. So both consumer and service provider gets the benefit of our app.

III. LITERATURE SURVEY

A. URBAN CLAP

The mobile application Urban Clap connects clients with service suppliers. Their goal is to connect a growing number of customers to the Urban Clap platform, making their lives easier and more comfortable. Customers desire to spend as much time as possible with their family, especially with the development of nuclear families and dual-career couples. Customers nowadays are open to change, and business concepts like Urban Clap, which delivers services to their doorstep with a simple mouse click, are here to stay.

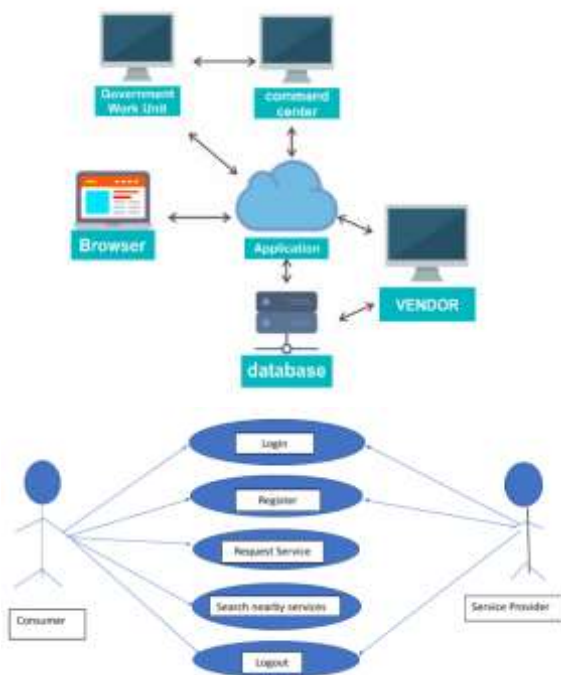

B. FORFIX

Forifix is an Integrated Pest Management initiative that was launched on September 5, Defense Day, to protect facilities against domestic terrorists (pests and their pollutants). It bridges a substantial gap between a serious household pain point and the horrifying solutions that one might ever risk. Forifix delivers safer, odorless, and environmentally friendly pest control products that have been authorized by the WHO/EPA and FDA.

C. HANDYMAN

The Handyman, which was founded on November 21, 2014, was Pakistan's first professional handyman service provider. The phrase "handyman" refers to technicians such as electricians, plumbers, air conditioning mechanics, carpenters, and wall painters. They have a staff of trained handymen accessible to help families and businesses with cleaning, electrical, plumbing, painting, and other projects that require immediate care, starting in Islamabad. They also offer cleaning and janitorial services, as well as repairs and construction management jobs (building or constructing a house, office, or a commercial plaza, or remodeling your property).

IV. METHODOLOGY

V. CONCLUSION

In the stated research paper, we have proposed an application to provide domestic services for a common person through other common working people around us. The point of our app being community driven is to remove the middle authorities : in the case of urban company , they have to hire employees , train them , build a management team, and all other things which are required to build a fully functional institution. Thus taking away a large margin of funds, and the expense would be carried out to the end user. In our case , the middle expenses are diminished, thus reducing the total cost to the consumer.

VI. FUTURE SCOPE

On our platform, it will be a totally user run community, owners can click images for the work site (where the work needs to be done) and send it to the worker, or post it publicly. This would let anyone visualize and analyze the work before accepting the service. Also they can negotiate with the respective worker and get the job done accordingly.
