Abstract— Distributed computing is the since quite a while ago envisioned vision of processing as a utility, where information proprietors can remotely store their information in the cloud to appreciate on-interest brilliant applications and administrations from a mutual pool of configurable registering assets. While information outsourcing mitigates the proprietors of the weight of nearby information stockpiling and support, it additionally kills their physical control of capacity trustworthiness and security, which generally has been normal by both undertakings and people with high administration level necessities. Keeping in mind the end goal to encourage quick arrangement of cloud information stockpiling administration and recapture security confirmations with outsourced information trustworthiness, proficient strategies that empower on-interest information accuracy confirmation for the benefit of cloud information proprietors must be outlined.

Key words: Databases, User interface, My-SQL Server Analysis, Implementation and Testing

I. INTRODUCTION:

In like manner utilization, the expression "the cloud" is basically an analogy for the Internet. Advertisers have further advanced the expression "in the cloud" to allude to programming, stages and base that are sold "as an administration". I.e. remotely through the Internet. Ordinarily, the vender has real vitality devouring servers which have items and administrations from a remote area, so end-clients don't need to; they can basically sign on to the system without introducing anything. The significant models of distributed computing administration are referred to as "Programming as administration", "Stage as administration". These cloud administrations may be offered in an open, private.

An expanding number of colleges and instructive foundations in the USA and UK are receiving cloud instruction for expanded expense reserve funds as well as for enhancing the productivity and comfort of instructive administrations.

II. MODULE DESCRIPTION

A. Admin Module

In this module admin can do anything and can handle all the tasks like creating the Staff, Announcing the Exam dates and also admin can watch all activities performed by both staff and user and admin can remove the unwanted users from the database.

B. User Module

User module is the second module used to enter in to the system to get the information which is going to be stored in the cloud server with secure and easy to access.

C. Registration Module

In this module both staff and student can get registered in to the E-cloud to get benefit and access to the cloud servers.

III. PROPOSED SYSTEM

Since the cloud uses shared assets numerous servers, pooled together, to make a cloud domain your information can, in fact, be put away close by another person's information, on the same physical server. In spite of the fact that cloud innovation is intended to keep everybody's data isolated, there is the potential for security vulnerabilities.

We proposed to secure client data from cloud environment. How we secure is by examining client log and their conduct on this cloud. Outsider why should impending split our site is by utilizing client account. So we follow every last client what the client doing in this site. Checking the client acutely can undoubtedly get the wafer who making trouble. We are setting an Auditor in like manner to both client and organization of whose data must be secure. Reviewer screens the data in the cloud. Follow every last exchange, overhauls, insertion and cancellation of information.

Therefore, numerous organizations decide to utilize a cross breed environment where they store their site's delicate data (e.g., client data, MasterCard numbers, and restorative data) on private, committed servers, while putting away non-touchy data in the cloud. Another arrangement is to utilize a private cloud, where we can construct our own particular cloud, on devoted servers that are utilized by clients. There are different reasons like Scalability, Cost Savings, Reliability, Business Agility, and Business Focus

IV. EXISTING SYSTEM

Flow System doesn't expand its usefulness for Overseas Business Process and outsourcing. The expense and human asset costs towards building business success with in the Locality are undesirable. The framework can't be upgraded to give dissemination of information to distinctive administrations. There are just restricted quantities of individuals can access with the current framework. Security less, control by clients will be more. Distributed computing has been imagined as the cutting edge structural engineering of the IT venture because of its considerable rundown of uncommon favorable circumstances in IT: on interest self-administration, omnipresent system access, area autonomous asset pooling, fast asset flexibility, use based valuing, and transference of danger. Safeguarding client is most part for the organization too for the clients. Client data is kept up just be administrator. In any case, in Cloud environment client data ought to be protected more than the other. Client information is not observed by any one.

A. Disadvantages:

- 1) Time-expending
- 2) A dreary assignment
- 3) Cause harm to the brand picture of the association
- 4) Slow updating and recovery

V. RESULTS

VI. CONCLUSION

It has been an incredible delight for me to chip away at this energizing and testing undertaking. This venture demonstrated bravo as it gave handy learning of not just programming in ASP.NET and VB.NET electronic application and no some degree Windows Application and SQL Server, additionally about all taking care of method related with "E-Cloud". It likewise gives learning about the most recent innovation utilized as a part of creating web empowered application and customer server innovation that will be extraordinary request in future. This will give better open doors and direction in future in creating tasks autonomously.
