Abstract—NLP (Natural language processing) is a technique for the mechanical analysis and illustration of human language. NLP is a IR (Information retrieval) systems which are shabby for discovery, within an immense text database, containing details desirable by a user. Natural language based IR system will be much constructive. Natural language processing based IR systems are extremely competent to indicate and manipulate the obscure query as complex and uncertain relationship presented among them. The conventional query in relational database management system is not capable of satisfying the needs for dealing with queries which are in natural language. In this paper we have discussed about a Intelligent IR’s and some fuzzy based query system, we have proposed an intelligent IR system based on natural language processing which uses fuzzy logic for query processing for complex queries. We have implemented a software tool which can execute complex query on natural language and we can fetch the information from the database very effortlessly which uses NLDBR architecture.

Key words: IR, NLDBR, Fuzzy sets

I. INTRODUCTION
Relational Database management systems (RDBMS) are extensively used software products in numerous types of systems. As we all are familiar with natural language which is the main communication means for humans, but this causes it not easy to handle damaged information. Unsatisfactory information can be incoherent, inexact, unclear, uncertain or vague. However, the Complexity is limited in specific data processing and is not capable of directly expressing fuzzy concepts of natural language.

Earlier system work based on the architecture as fig. 1 in which user get the database information in his/her language. The drawback of this system was that user has to fire queries in WH type question, it also did not support single word query, ambiguous words care was taken while processing query. A limited data dictionary was used in which words were updated after regular period of time. All the name in the Natural language query had to be in double quotes (“”). The system reduced the part of user but not to that extent that user required again he had to keep some of the things in mind that the name should in double quotes, query should consist of words that were present in the data dictionary, and the query had to be in WH question type and so on.

In our proposed work we have taken advantages of earlier research and to reduce the complexity of natural language user query we have adopted fuzzy set approach.

In next section we will go through different literatures of natural language query processing, section 3 we will discuss the problems of earlier research work, section 4 we will describe our proposed work, further in result and discussion section we will describe experimental evaluations, at last we will conclude our research work.

II. LITERATURE SURVEY
We have gone through various literature of natural language query processing research work.

Fei Li et. al. presents NaLIR, a generic interactive natural language interface for querying relational databases. NaLIR can accept a logically complex English language sentence as query input. This query is first translated into a SQL query, which may include aggregation, nesting, and various types of joins, among other things, and then evaluated against an RDBMS. In this demonstration, we show that NaLIR, while far from being able to pass the Turing test, is perfectly usable in practice, and able to handle even quite complex queries in a variety of application domains. In addition, we also demonstrate how

III. PROBLEM IDENTIFICATION

The intricate and weak understood semantics of documents and user queries has prepared feedback and alteration important distinctiveness of any IR systems. Hence natural language based IR system will be much favorable. Natural language processing based IR systems are enormously capable to symbolize and manipulate the intricate query as complex and uncertain relationship presented among them. We have gone through various literatures in section 2 and found some bottleneck in natural language query processing which are as follows:

- Difficulty of translating user-specified query structure to the actual schema structure in the database.

IV. PROPOSED ARCHITECTURE

The conventional query in relational database management system is not capable of satisfying the needs for dealing with queries which are in natural language. After going through different literature survey we have concluded that the earlier systems were not that much vital to as per the user’s prospect. It condensed the user part of recalling the syntax but not to that amount. The system only provided search interface for only partial database due to that user was obligatory to input queries according to that database.

Fig. 2: Proposed System Architecture

We have proposed an intelligent IR system based on natural language processing which uses fuzzy logic for query processing for complex queries. We have implemented a software tool which can execute complex query on natural language and we can fetch the information from the database very effortlessly.

V. RESULT AND DISCUSSION

For implementation of our project we have used java platform. We have overcome the some drawbacks of earlier system by applying fuzzy set based query processor.

Fig. 4: Performance Comparison
VI. CONCLUSION

The conventional query in relational database management system is not capable of satisfying the needs for dealing with queries which are in natural language. In this paper we have discussed about some Intelligent IR’s and some fuzzy based query system, we have proposed an intelligent IR system based on natural language processing which uses fuzzy logic for query processing for complex queries. We have implemented a software tool which can execute complex query on natural language and we can fetch the information from the database very effortlessly.
